

Modules

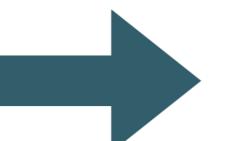

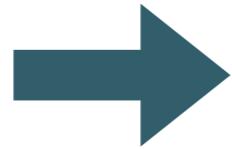

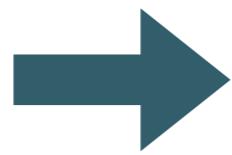

Javascript Modules

- To structure an application coherently, the backend consists of separate Javascript files.
- Objects declared in these files must be
 - exported by one file
 - imported by another
- In order to keep each module focused on a specific responsibility

Example

- 2 separate object defined in a single file
- Methods called on these objects at the end of the file

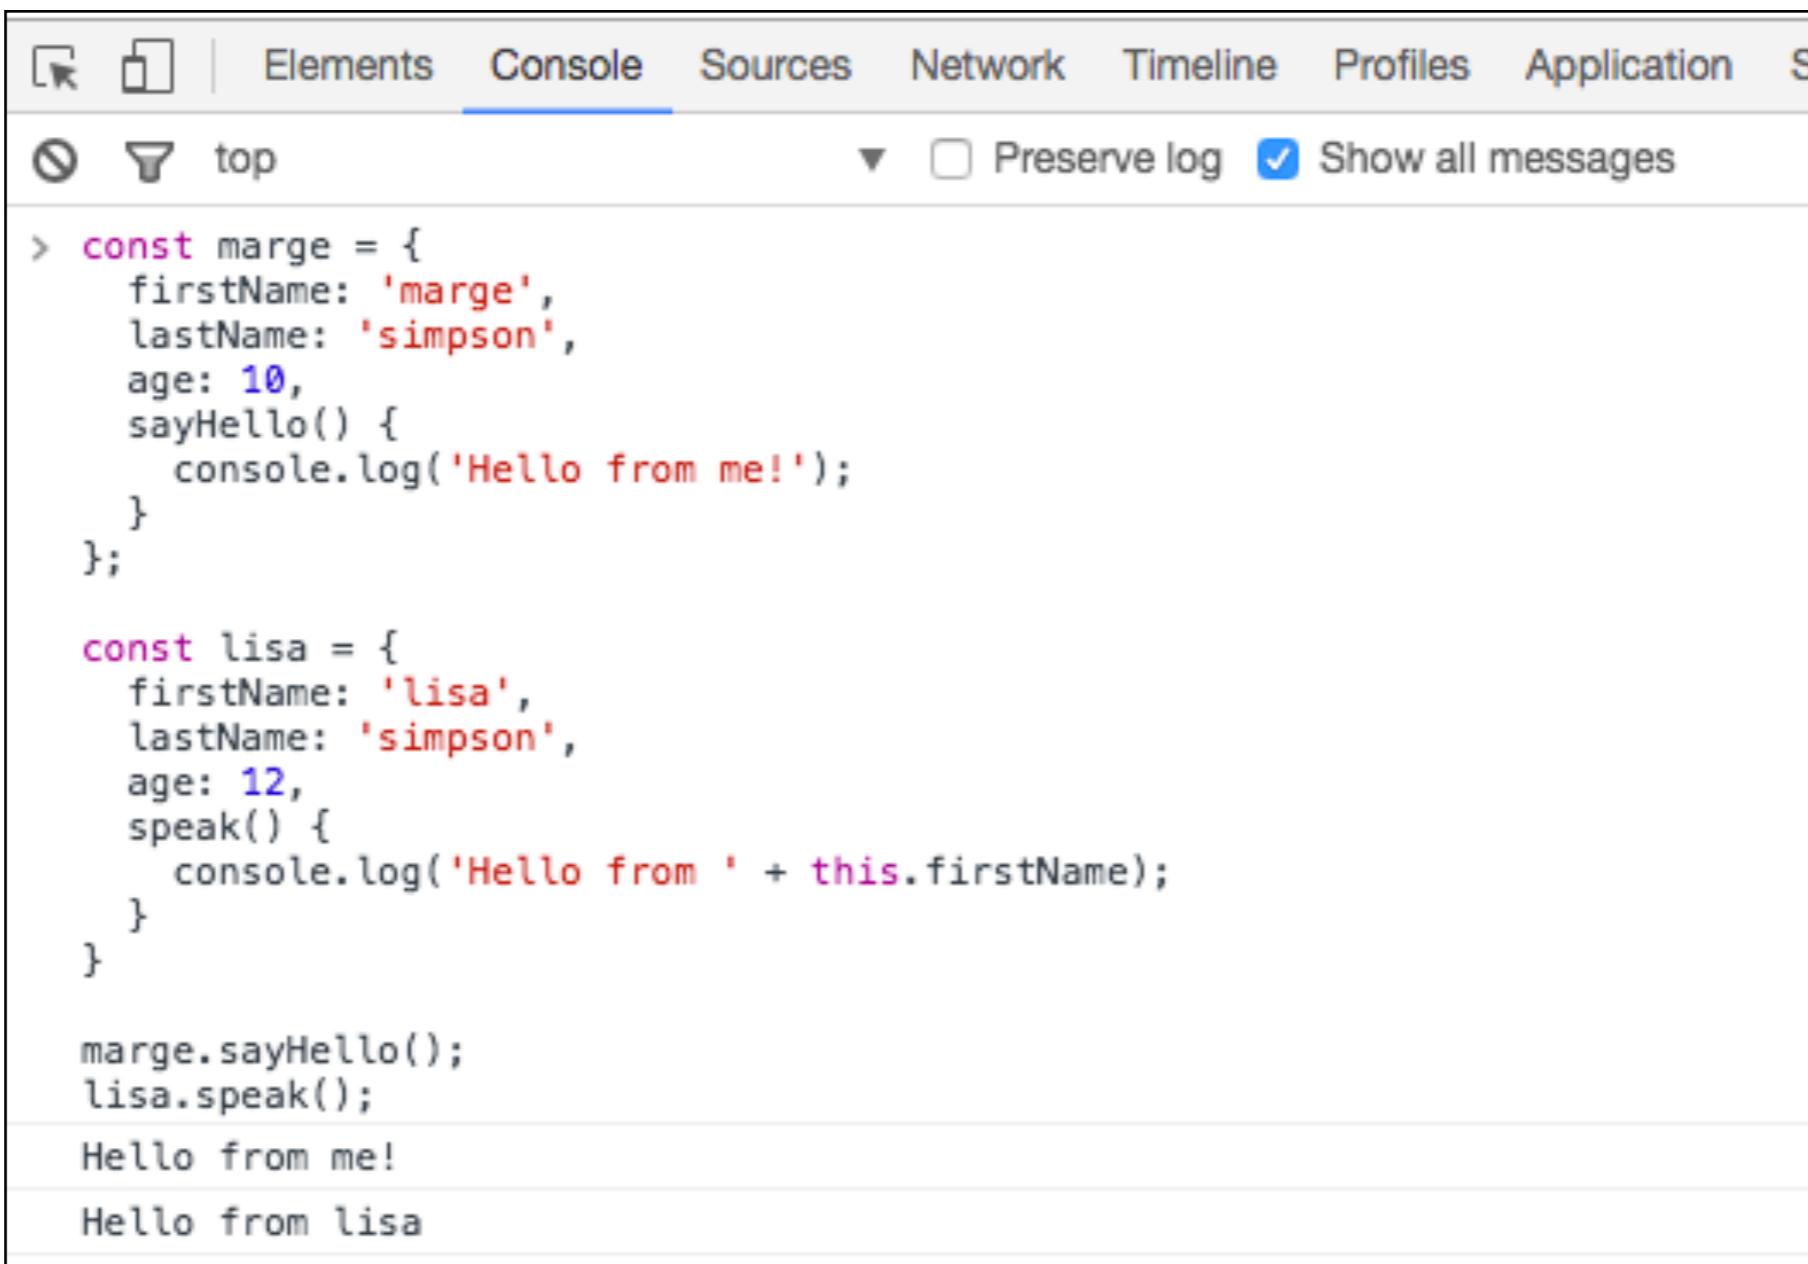

standalone.js

```
const marge = {
  firstName: 'marge',
  lastName: 'simpson',
  age: 10,
  sayHello() {
    console.log('Hello from me!');
  }
};

const lisa = {
  firstName: 'lisa',
  lastName: 'simpson',
  age: 12,
  speak() {
    console.log('Hello from ' + this.firstName);
  }
}

marge.sayHello();
lisa.speak();
```

In Chrome JS Console

The screenshot shows the Chrome DevTools interface with the 'Console' tab selected. The console output displays the execution of a script involving two objects, marge and lisa, and their respective methods sayHello() and speak(). The output shows the results of these method executions.

```
> const marge = {
    firstName: 'marge',
    lastName: 'simpson',
    age: 10,
    sayHello() {
      console.log('Hello from me!');
    }
};

const lisa = {
  firstName: 'lisa',
  lastName: 'simpson',
  age: 12,
  speak() {
    console.log('Hello from ' + this.firstName);
  }
}

marge.sayHello();
lisa.speak();
Hello from me!
Hello from lisa
```

Modularise the Program

```
standalone.js  
  
const marge = {  
  firstName: 'marge',  
  lastName: 'simpson',  
  age: 10,  
  sayHello() {  
    console.log('Hello from me!');  
  }  
};  
  
const lisa = {  
  firstName: 'lisa',  
  lastName: 'simpson',  
  age: 12,  
  speak() {  
    console.log('Hello from ' + this.firstName);  
  }  
}  
  
marge.sayHello();  
lisa.speak();
```

```
marge.js  
  
const marge = {  
  firstName: 'marge',  
  lastName: 'simpson',  
  age: 10,  
  sayHello() {  
    console.log('Hello from me!');  
  }  
};
```

```
lisa.js  
  
const lisa = {  
  firstName: 'lisa',  
  lastName: 'simpson',  
  age: 12,  
  speak() {  
    console.log('Hello from ' + this.firstName);  
  }  
};
```

```
main.js  
  
marge.sayHello();  
lisa.speak();
```

History 

```
/* ---
```

RequireJS is a JavaScript file and module loader. It is optimized for in-browser use, but it can be used in other JavaScript environments, like Rhino and [Node](#). Using a modular script loader like RequireJS will improve the speed and quality of your code.

IE 6+	compatible ✓
Firefox 2+	compatible ✓
Safari 3.2+	compatible ✓
Chrome 3+	compatible ✓
Opera 10+	compatible ✓

```
--- */
```

Modularise the Program

- These three modules:
 - marge.js
 - lisa.js
 - main.js
- Are completely separate.
- main.js cannot use marge or lisa objects

```
marge.js  
const marge = {  
    firstName: 'marge',  
    lastName: 'simpson',  
    age: 10,  
    sayHello() {  
        console.log('Hello from me!');  
    }  
};
```

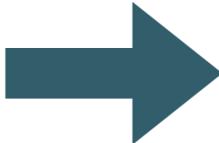

```
lisa.js  
const lisa = {  
    firstName: 'lisa',  
    lastName: 'simpson',  
    age: 12,  
    speak() {  
        console.log('Hello from ' + this.firstName);  
    }  
};
```

```
main.js  
marge.sayHello();  
lisa.speak();
```

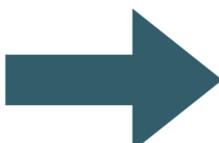

module.exports

module.exports makes
the listed object available
to other modules

```
marge.js
const marge = {
  firstName: 'marge',
  lastName: 'simpson',
  age: 10,
  sayHello() {
    console.log('Hello from me!');
  }
};

module.exports = marge;
```

```
lisa.js
const lisa = {
  firstName: 'lisa',
  lastName: 'simpson',
  age: 12,
  speak() {
    console.log('Hello from ' +
      this.firstName);
  }
};

module.exports = lisa;
```

require

marge.js

```
const marge = {
  firstName: 'marge',
  lastName: 'simpson',
  age: 10,
  sayHello() {
    console.log('Hello from me!');
  }
};

module.exports = marge;
```

lisa.js

```
const lisa = {
  firstName: 'lisa',
  lastName: 'simpson',
  age: 12,
  speak() {
    console.log('Hello from '
      + this.firstName);
  }
};

module.exports = lisa;
```

main.js

```
const marge = require('./marge.js');
const lisa = require('./lisa.js');

marge.sayHello();
lisa.speak();
```

require identifies and
imports objects defined
in other modules →

Modules in back-end - Example

```
back-end +  
├── .env  
├── .gitignore  
├── .jscsrc  
└── controllers/  
    ├── about.js  
    ├── dashboard.js  
    └── start.js  
└── package.json  
└── README.md  
└── routes.js  
└── server.js
```

- 5 separate modules
 - sever.js
 - routes.js
 - controllers
 - about.js
 - dashboard.js
 - start.js
- Each of these modules will use export and require to establish dependencies
